A: You can use this example code. `$curl = curl_init(); curl_setopt($curl, CURLOPT_URL, $url); curl_setopt($curl, CURLOPT_HEADER, 0); curl_setopt($curl, CURLOPT_RETURNTRANSFER, 1); curl_setopt($curl, CURLOPT_POST, 1); $result = curl_exec($curl);` And change the data as it suits you. For more details see: that I can't use a certain piece of software I want. A factor that just recently became important to me is that I don't want to have to rebuild my OS because of bug-ridden software. I don't know how much I'd pay for a barebone, but I know what I'd look for: 1) Cheap 2) Able to run both Windows and Linux 3) Fast as hell and not very big 4) Optimized for gaming I guess the bottom line is that I'd really prefer to be able to go to a store, buy a computer, and have it work out of the box. On January 26, 2011 at 12:20pm, Bbking wrote: In any case, I think the best course of action would be to look up a system that could be used for both Windows and Linux. Since Windows is a better choice for gaming, I think that's what you'd be better off with, but there are many ways to build a computer that can run both. For instance, I was a member on a forum that was quite successful in building PCs that could be used both by those who mainly use Windows and those who mainly use Linux. But in any case, I agree that it would probably be best to look for a system that can be used for both if you're going to use Windows. And finally, thanks for the suggestions. When I said I was going to start looking for a barebone system, I didn't think I'd find that many systems that can run both Windows and Linux. And when I did, I was very surprised. I would definitely like to know which one you recommend as well. On January 26
